

ABSTRACT

The first aid kit of the present invention includes a case that includes means for providing quick access to the contents carried by the case. The case further provides, on the inside, a plurality of regions, defining compartments, arranged in an accordion style columnar array. Contained in the compartments are packs which are specifically designed with products appropriate for a particular first aid situation arranged according to a system of medical priorities following the principle of triage, from the most serious to the least serious first aid situation. The first aid kit further provides an guidebook that contains detailed instructions regarding the products contained in each pack as well as instructions on use of the products for different types of first aid situations. The first aid kit further includes an overview card that is an overview of the components of the first aid kit, identifying each of the packs for quick reference in a first aid situation. Each of the packs contains medical products specifically selected for different types of first aid situations as well as an instructional card that gives quick reference instructions for administration of first aid in these situations.
